Science. Applied to Life.™

3M[™] Coban[™] 2 Layer Compression Systems

3M[™] Coban[™] 2 Layer Compression Systems are designed to deliver comfortable, therapeutic compression for the treatment of venous leg ulcers, lymphedema and other conditions where compression therapy is appropriate.

Comfortable, Effective

Designed for Effectiveness

Studies from clinicians around the world, including randomized controlled trials, provide evidence that Coban[™] 2 Layer Compression Systems:

- Provide sustained compression without slipping
- Reduce chronic edema
- Support healing and reduce the size of venous leg ulcers
- Significantly reduce pain on legs¹
- Are safe and well-tolerated²
- Are easy to apply, easy to remove
- Are preferred by patients*³

*Applicable only to 3M[™] Coban[™] 2 Layer Compression System.

Designed for Consistent Application

Compression is therapeutic when sufficient pressure is applied. Too little pressure will minimize the benefits and too much pressure may cause damage or not be tolerated by the patient. We designed our compression layer to be applied at full stretch, eliminating guesswork.

In an international, multi-centre comparative evaluation, 32 expert bandagers applied their most familiar bandage system to an artificial limb with pressure sensors: **the bandagers were able to apply significantly more consistent compression using Coban 2 Layer Compression System** because of the full stretch application. The bandagers also found Coban 2 Layer Compression System faster and easier to apply.⁴

Compression

Designed for Comfort, Mobility and Daily Living

Coban 2 Layer Compression Systems provide sustained, therapeutic compression for up to 7 days.¹ The thin, lightweight materials create a breathable sleeve that allows patients to wear their own shoes and clothing. Because the bandages are comfortable to wear, patients are more likely to keep them on, increasing concordance and the potential for effective treatment.^{5,6}

The two-layer system generates sustained working pressures and comfortable resting pressures, making the compression easy to tolerate regardless of activity level.

For patients less tolerant of compression therapy patients with mixed etiology and ABPI ≥ 0.5, who are frail, or who are less mobile - the Coban[™] 2 Layer Lite Compression System is appropriate.

> "Coban 2 Layer Compression Systems have proven to be invaluable in reducing edema and affording improved quality of life. The simplicity of consistent application of Coban 2 Layer Compression Systems has afforded versatility in both the acute and community setting - including rural sites."

> > - Rosemary Hill

Designed to Stay in Place

Our patented, interlocking materials cohere to each other, creating an inelastic sleeve that gently grips the skin and reduces the potential for uncomfortable slipping or bunching.^{3,5}

In a randomized, controlled trial, patients reported significantly less slippage with Coban 2 Layer Compression System compared to Profore[™].¹

ABPI < 0.5: Very Severe and Severe Ischemia Compression should not be used

ABPI 0.5-0.8: Moderate and Mild Ischemia 3M[™] Coban[™] 2 Layer Lite Compression System

ABPI ≥ 0.8: Normal

3M[™] Coban[™] 2 Layer Lite Compression System, 3M[™] Coban[™] 2 Layer Compression System

Position Statement on the Use of the Ankle Brachial Index in the Evaluation of Patients with Peripheral Vascular Disease. A Consensus Statement Developed by the Standards Division of the Society of Interventional Radiology.

ABIs as high as 1.10 are normal; abnormal values are those less than 1.0. The majority of patients with claudication have ABIs ranging from 0.3 to 0.9. Rest pain or severe occlusive disease typically occurs with an ABI lower than 0.50. Indexes lower than 0.20 are associated with ischemic or gangrenous extremities.
